

Energy Industry in Malaysia

General State of the Economy

Malaysia is a country in Southeast Asia consisting of two noncontiguous regions separated by the South China Sea. Peninsular Malaysia borders with Thailand to the north, and East Malaysia located on the island of Borneo shares

it with Brunei and Indonesia. In addition, Malaysia has maritime borders with Singapore, Vietnam, the Philippines, Indonesia, and Thailand. According to 2023 statistics, Malaysia, which ranks 68th in the world in terms of the size of its territory, is home to around 34 million people. In terms of population density, the country occupies

Malaysia

Capital: Kuala Lumpur	Density: 98 km ²	Currency: Malaysian ringgit (RM) (MYR)
Official languages: Malay	Life expectancy at birth: 76.13 years	GDP (PPP): \$1.307 trillion (2024 est.)
National Day: 31 August	Area (land): 328,657 km ²	GDP - per capita (PPP): \$39,069 (2024 est.)
Population: 33,200,000 (2023 est.)	Coastline: 4,675 km	Internet country code: .my

Source: [1,2,3]

Kuala Lumpur at night

the 121st place in the world. The length of the country's coastline is 4,675 km (Peninsular Malaysia – 2,068 km, East Malaysia – 2,607 km). Malaysia is a federal parliamentary constitutional monarchy. The national capital and the country's largest city is Kuala Lumpur and the city of Putrajaya serves as the administrative center of Malaysia. The country is divided into 13 states and one federal territory [1,2,3].

The rating positions of Malaysia relative to other countries have been determined for an extensive list of economic, energy, innovative and educational indices, as well as for metrics reflecting the state of the environment. The economic indices include, for example, GDP per capita, annual average GDP growth, high-technology exports, and others. The list of energy indices includes proven reserves of oil, gas and coal, production-consumption ratio combined, and energy use, etc. Each

of the indices has a ranked list of included member countries. Since the number of countries in each rating is different for each index, the positioning of the country of interest is displayed on a special chart, where the vertical axis is a uniform relative scale from 0 to 1, whereas the horizontal axis denominates the various indices and respective numbers relating to the descriptions given underneath.

Thus, in such a relative “0-1” diagram, the country's position is marked with a dot in proportion to its location in the original rating list. If the country is among the leaders regarding the selected indicator, it will be marked close to 1 in the upper green zone on the relevant chart “0-1”, if the country is an outsider in the rating list, then it will be marked in the lower red zone of the chart “0-1”, etc.

Ranking position of Malaysia for list of economic indices:

Figure 1. Economic indices of Malaysia

For the majority of indices the positioning of the country is higher than the world average, for seven indices Malaysia is placed among the top quarter of the world's countries included in the rating. Of the indices presented, the country has the highest values for High technology exports and Reserves (0.93), the 2021 Index of Economic

Freedom (0.88), and Reserves of foreign exchange and gold (0.87). The weakest spot within Malaysian economics is the Public debt (% of GDP) (0.41), the only one indicator where the country takes up a position below the middle of the rankings.

Energy resources

Malaysia has distinct proven reserves of fossil fuels in the form of natural gas and crude oil. The share of natural gas is 0.58% of the world's total, the share of oil is 0.21%. The country's coal reserves are only 0.02% of the world total [4]. The share of Malaysia's population makes up about 0.42% of the world's population. However, at

the same time, gas and oil reserves in Malaysia are significantly lower than those of the world leaders. For instance, gas reserves are about 20 times less than in Qatar, while oil reserves are more than 58 times less than in Iran [4,5].

In terms of tons of oil equivalent, according to 2024 data, conventional proved reserves by fuel type were: 62.3% – natural gas, 28.5% – oil, and 9.2% – coal (Fig.5).

Table 1. Fossil energy resources of Malaysia

Resource/Explanations	Crude oil*	Natural gas*	Coal*	Tight Oil**	Shale Gas**
Value	3.6 (0.21%)	42 (0.58%)	249 (0.02%)	no date	no date

*share of the country's reserves in world total is provided in brackets

**unproved technically recoverable

Hydropower prevails in terms of installed renewable energy capacities (almost 89.2%), followed by bioenergy (9.4%), and solar photovoltaics (about 1.4%). Moreover, hydropower plays a significant role in Malaysia's power generation, contributing about 16% to all electricity produced in 2021. However, the country does not completely use its very high overall hydropower potential (414,000GWh per year [5]).

Although some areas of Malaysia, such as the west-north coast of the island of Borneo, have relatively strong winds

reaching 5.0-5.5 m/s at 50 m at certain times of the year, in general the country experiences low wind speeds. Thus, wind power does not have a strong potential in terms of the development of renewable energy sources. This doesn't apply to solar power generation, which could be much higher due to the favourable climate conditions. The highest DNI solar intensity reaches 5.2-5.3 kWh/m² per day, which is recorded in the north-eastern part of country, in Sabah state on the northern portion of Borneo.

Table 2. Renewable energy resources of Malaysia

Resource/ explanations	Hydro Energy Potential	Solar Potential (GHI)*	Wind Potential (50 m)*	Bio Potential (agricultural area)	Bio Potential (forest area)	Municipal Solid Waste
Value	414,000GWh per year/4,000 potential sites for off-rive pumped hydro	4.9-5.2	3.0-5.0	26.1	58.2	1.21
Unit	-	kWh/m ² /day	m/s	% of land area	% of land area	kg/per capita/day

Energy balance

According to [4], in 2022 in Malaysia, the total production of primary energy was 4.185 quadrillion Btu, while consumption was at the level of 3.954 quadrillion Btu. Thus, the share of domestic consumption in primary energy production was 94.5%. This makes Malaysia a coun-

try independent of energy imports. According to the BP Statistical Review of World Energy 2022, primary energy consumption in Malaysia in 2021 amounted to 4.19 exajoules and was dominated by natural gas – 35.3%, followed by oil – 34.8%, coal – 21.2%, hydroelectricity – 7.2%, and other renewables – 1.4% [5].

Source: U.S. Energy Information Administration (Mar 2024) / <https://www.eia.gov/>

Figure 2. Production and consumption of fossil fuels in Malaysia (left–coal, in the center– gas, right–oil)

Malaysia's natural gas production far exceeds domestic demand: in 2022, gas consumption was almost half that of its production. In contrast, the consumption of coal is about 10 times higher than its production. In the last ten years, oil production and consumption have been roughly the same, with slight fluctuations in one direction or the other. In 2022, for example, oil consumption was approximately 10% higher than oil production.

Figure 3. Electricity Generation in Malaysia

Total electricity generation in Malaysia has grown by mately 81.4% of electricity was produced by thermal about 69% over the past ten years and consumption is power plants, 16.9% – by hydroelectric power plants, and entirely met by domestic production. In 2022, approxi- 1.7% by other renewable sources.

Figure 4. Energy indices of Malaysia

Malaysia's significant fossil fuel resources are definitely reflected in the energy index chart, where the country has the best indices among those presented for the Production-consumption ratio of natural gas (0.93) and crude oil (0.86). In contrast, the weakest spot in Malaysia's energy indicators is the Coal production-consumption ratio (0.05), since coal demand far exceeds domestic output. Insufficient involvement of renewables in the country's energy mix has contributed to the relatively low rating in the indicator for the Electricity pro-

duction from other renewable sources (0.34) and in the The Global Energy Architecture Performance Index Report (0.32).

Energy Infrastructure

A territorial map showing distribution of the largest infrastructure projects of the fossil fuel sector in Malaysia is displayed in Figure 5. As mentioned earlier, natural gas reserves account for 62.3% of all proven reserves of fossil fuels, oil – for 28.5%, and coal – for 9.2%. The main gas fields under development are located offshore, both in Peninsular Malaysia, and in the regions of

Sabah and Sarawak. Key natural gas processing plants are concentrated in the eastern part of the Peninsular Malaysia. According to U.S. Energy Information Administration, as of 2019, Malaysia is the fifth-largest exporter of LNG in the world. The giant Malaysian LNG export facility is located in the small town of Bintulu in Sarawak state, where the first commercial gas-to-liquids plant from Shell also operates.

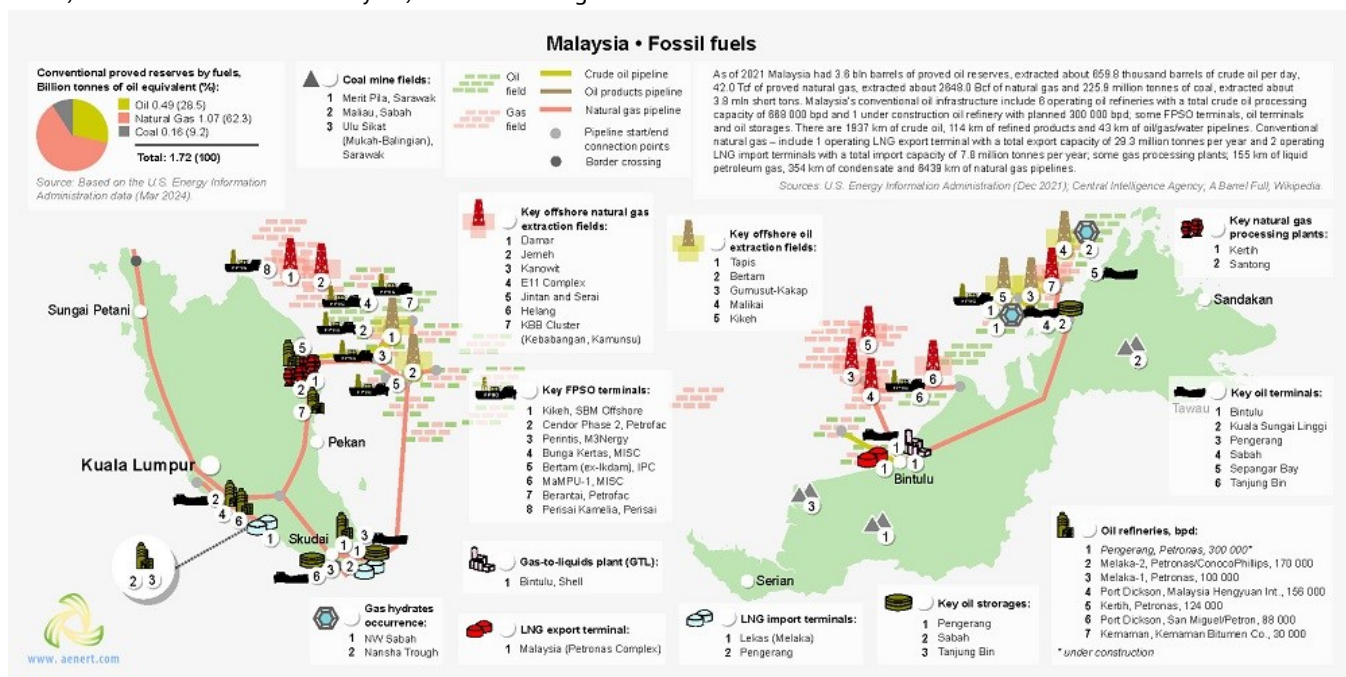

Figure 5. Basic infrastructural facilities of the fossil fuel sector in Malaysia

Most of the Malaysian crude oil comes from marine fields on the country's continental shelf. The map above

illustrates the main offshore oil extraction fields, operating refineries and oil storages in both parts of the

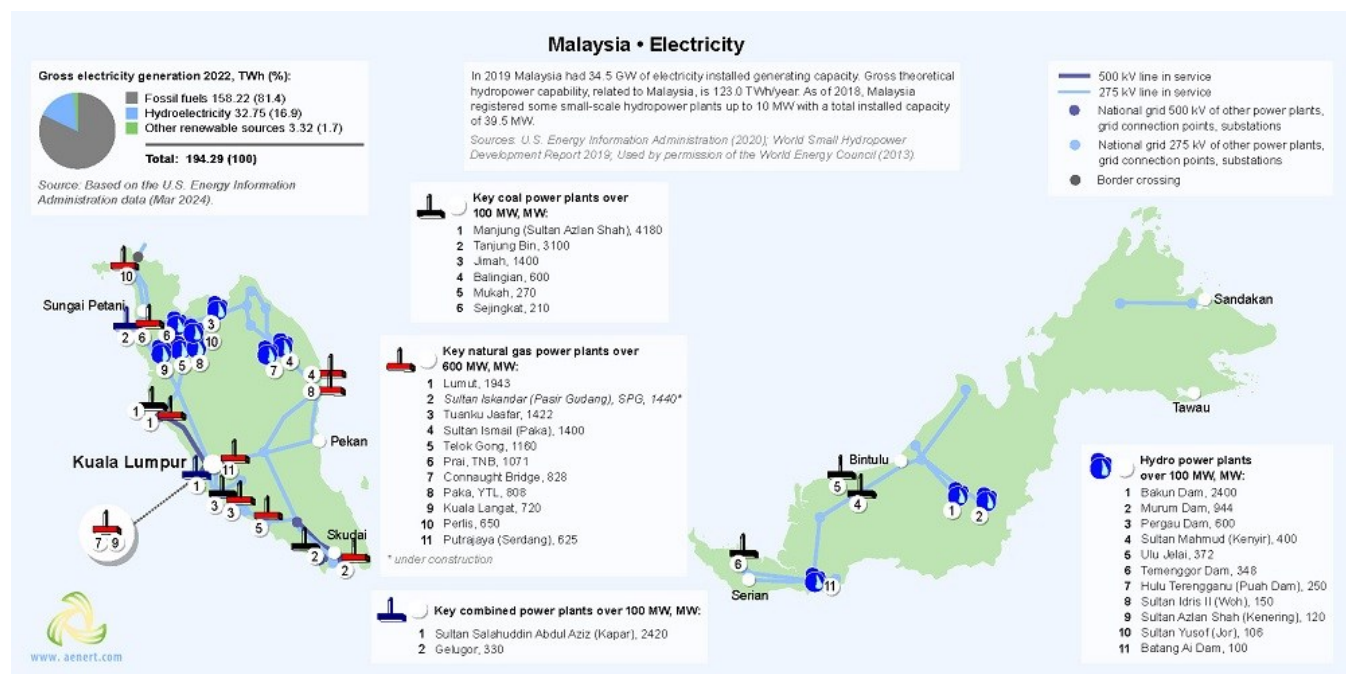

Figure 6. Electricity production in Malaysia

country. The Pengerang terminal at the southern tip of Peninsular Malaysia is the country's largest commercial oil storage facility.

Coal mining is carried out mainly in Borneo Malaysia, in the states of Sabah and Sarawak.

Electricity generation in Malaysia is to about 81% provided by fossil fuel-fired power stations, met mostly by coal and natural gas. Hydropower also plays a significant role, accounting for about 17% of Malaysia's generating

capacity, with the Bakun power plant in Malaysian Borneo being the largest hydropower facility in the country with an installed capacity of 2,400 MW. As Figure 3 shows, the demand for electricity in Malaysia continues to grow year after year, and the government plans to reform the country's power sector, not least by tapping and further developing its relatively abundant hydropower resources [13].

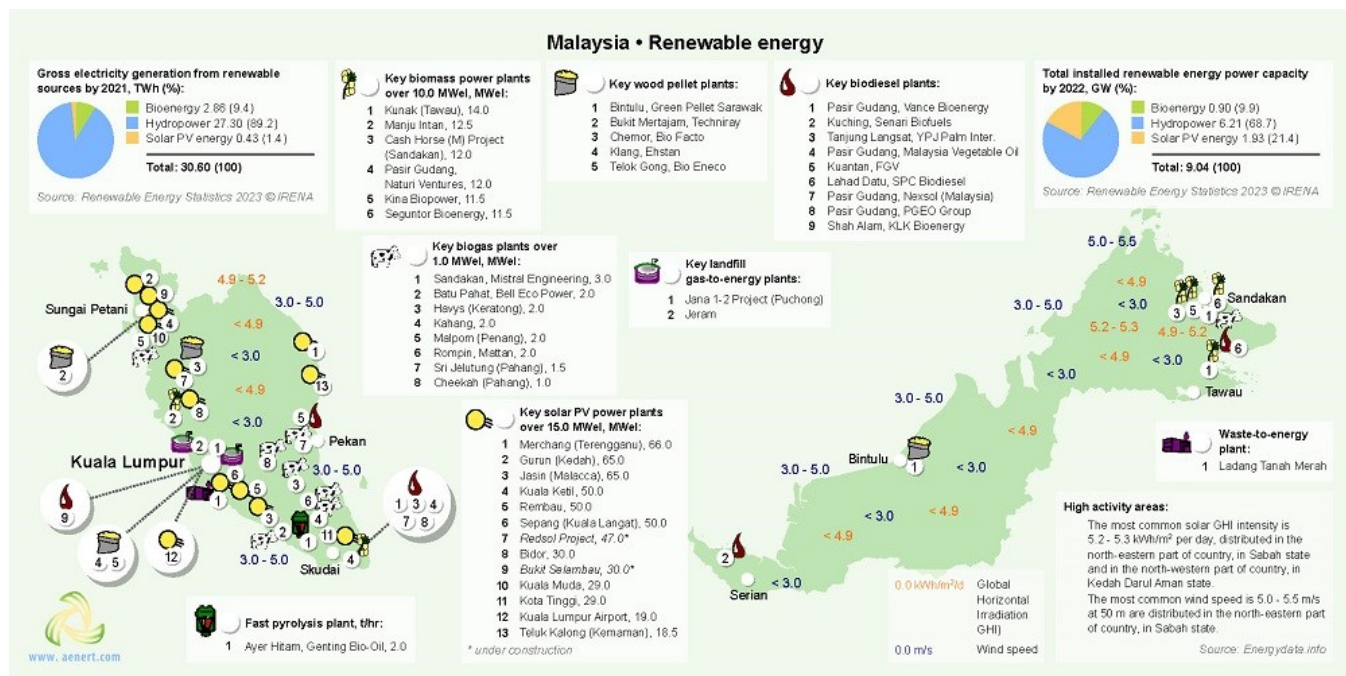

Figure 7. Renewable energy in Malaysia

Hydropower prevails in terms of installed renewable energy capacities (about 70%), followed by solar photovoltaics (about 20%). The share of bioenergy in 2021 was just over 10%. At the same time, the volume of electric power generation by hydroelectric power plants in 2021 was about 89.2% of the total of all renewable sources, followed by bioenergy (9.4%) and solar PV (1.4%). Solar power plants are distributed across the Peninsular Malaysia with the installed capacity between 18 and 66 MWel. Among other sectors of renewable energy, bioenergy is under active development in Malaysia, especially the production of biogas and biodiesel.

According to the National Energy Policy Plan, the Malaysian government aims to achieve carbon neutrality and 70% renewable energy in the energy mix by 2050. Reaching this goal will require more than a tenfold in-

crease in capacity from 2023 to 2050. The country has set a target of 40% renewable energy in the energy mix by 2035 [13].

Education and Innovation

The following chart shows Malaysia's positions in terms of education and innovation:

Figure 8. The indices of education and innovation in Malaysia

Malaysia shows no extremes in the education and innovation sector – all indices are located in the middle or in the upper part of the chart. Among them, Malaysia's best indicators relate to the Scientific and technical journal articles (0.90), the SCImago Country Rankings (0.87), and the Number of Internet Users (0.87). Patents in force (0.66) and Government expenditure on education (0.66)

are the lowest indicators in the chart, but still above the world average.

Ecology and Environment Protection

Indicators related to environmental issues are presented in the following diagram:

Data from 1990 are CAIT data: Climate Watch. 2020. GHG Emissions. Washington, DC: World Resources Institute. Available at: License : Attribution-NonCommercial 4.0 International (CC BY-NC 4.0) *191
 9. The Climate Change Performance Index (CCPI) 2022 / Overall Results / Jan Burck, Thea Uhlich, Christoph Bals, Niklas Höhne, Leonardo Nascimento / Germanwatch, NewClimate Institute & Climate Action Network *60
- * Total number of countries participating in ranking

Figure 9. Environmental Indices of Malaysia

Malaysia belongs to the group of countries with the largest amount of carbon dioxide (0.12) and methane emissions (0.19). These facts are partly responsible for its low ranking in the National Footprint Accounts (0.32) and the 2022 Climate Change Performance Index (0.11). On the other hand, among the positive indicators is the significant area of forests in the country (0.85), as well as a positive trend to their increase (0.92). In general,

the environmental situation in the country requires significant improvement.
